

Measurement instructions for frame mosquito nets

Open the window sash and measure the size of the outer window frame as shown on the illustration.

By measuring the width and height, check the distance between the inner edges.

Providing the desired dimensions, enter the values of your measurements in the configurator:

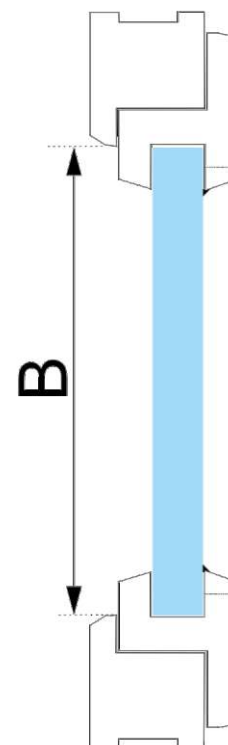

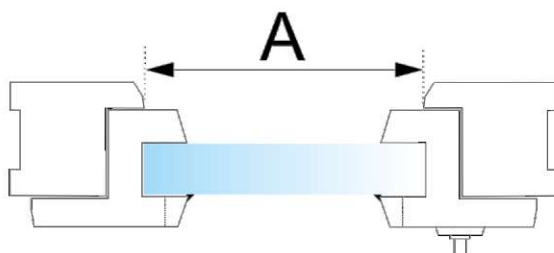

Width = A

Height = B

Dimensions are provided in millimetres (mm).

If the window sash is equipped with a drip protruding outside the window frame, then the installation of the mosquito net is impossible.

The overall size of the mosquito net will be 24 mm wider and 24 mm higher than the given measurement A and B.

This is because the frame flange is 12 mm.

Below the cross-section of the frame.
